## ↑ INDEX TERMS

### Primary Classification:

I. Computing Methodologies

↳ I.4 IMAGE PROCESSING AND COMPUTER VISION

### Additional Classification:

I. Computing Methodologies

↳ I.3 COMPUTER GRAPHICS

J. Computer Applications

↳ J.2 PHYSICAL SCIENCES AND ENGINEERING

↳ **Subjects:** Engineering

### General Terms:

Design, Performance, Theory

### Keywords:

behavioral scenario, conceptual design techniques, design environment, functional modeling

 Volume 32 Issue 10  
 Object relationships in modern software systems are becoming increasingly numerous and complex. Programmers who try to find violations of such relationships need new tools that allow them to explore objects in a large system more efficiently. Many existing debuggers present only a low-level, one-object-at-a-time view of objects and their relationships. We propose a new solution to overcome these problems: query-based debugging. The implementation of the query-based debugger described here offers ...

 Volume 6 Issue 1  
 This article analyzes the semantics of task dependence and termination in Ada. We use a contour model of Ada tasking in examining the implications of and possible motivation for the rules that determine when procedures and tasks terminate during execution of an Ada program. The termination rules prevent the data that belong to run-time instances of scope units from being deallocated prematurely, but they are unnecessarily conservative in this regard. For task instances

### The following characters have specialized meaning:

Special Characters	Description
, ( ) [	These characters end a text token.
= > < !	These characters end a text token because they signify the start of a field operator. (! is special: != ends a token.)
` @ \Q < { [ !	These characters signify the start of a delimited token. These are terminated by the end character associated with the start character.
